Physical and mental abuse, gang-related violence, homelessness and neglect are just a few of the dangers that a child must face. Child welfare officers, school social workers, and family service providers have been the primary line of defense against these hazards, but in order to provide a more effective form of social care, these fields must be seen as an integrated whole. They must also have the skill to act as multidisciplinary teams. Taken from an issue of the journal Early Child Development and Care, Reassessing Social Work Practice with Children provides professionals with a dynamic orientation that offers a holistic approach to social work practice with children. This view encompasses any and all measures of practice designed to protect and promote the bio-psycho-social development of children, including education, protective services, and substitutive services.

The past decade has witnessed a considerable upsurge of clinical and research interest in the problems of developmentally and physically the fields of psychology, disabled persons. Indeed, professionals from special education, rehabilitation, psychiatry, and social work have all directed attention to the development and implementation of evaluation and remedial programs. The heightened activity in this area is in part a result of early assessment research with these populations, which provided preliminary evidence of difficulties in social and emotional adjustment in many disabled individuals. In response to these findings, many intervention efforts have been implemented to deal with these issues and improve the life situation of the disabled. Also, there were indications that developmentally and physically disabled children often were deprived of adequate educations. As a result, legal and legislative initiatives have been enacted in recent years to make public education available to all students irrespective of disability. Central to all therapeutic and psychoeducational endeavors with the disabled is psychological evaluation. Only through careful and comprehensive psychological evaluation can areas of deficit as well as strengths be identified. Once treatment targets and goals have been ascertained, psychological evaluation is needed to determine the efficacy of intervention strategies. However, the field of psychological evaluation, in general, and with disabled persons, in particular, has become highly specialized. This is largely a function of the changing roles of psychological evaluators.

Established for fifteen years as the standard work in the field, Melvin Lewis's *Child and Adolescent Psychiatry: A Comprehensive Textbook* is now in its Fourth Edition. Under the editorial direction of Andrés Martin and Fred R. Volkmar—two of Dr. Lewis's colleagues at the world-renowned Yale Child Study Center—this classic text emphasizes the relationship between basic science and clinical research and integrates scientific principles with the realities of drug interactions. This edition has been reorganized into a more compact, clinically relevant book and completely updated, with two-thirds new contributing authors. The new structure incorporates economics, diversity, and a heavy focus on evidence-based practice. Numerous new chapters include genetics, research methodology and statistics, and the continuum of care and location-specific interventions. A companion Website provides instant access to the complete, fully searchable text.

All children possess a motive to 'master' the various tasks and problems that they face. Without mastery motivation, it is doubtful whether children would make progress in cognitive, social communicative and other domains. Although all children possess this motivation, it will vary according to inherited dispositions and to environmental experiences. This makes mastery motivation a key factor in understanding later developmental and educational achievement. Concentrating on pre-school children, this volume, originally published in 1993, brought together current research work and thinking concerned with mastery motivation at the time. New ideas are presented about the way mastery is related to other developmental processes such as self-concepts and attention. There are discussions and findings about innovations in the methods of assessing mastery. Another important theme present in this volume, is the way in which features of social interaction, attachment and the environment influence the development of mastery motivation. With a broad range of international contributors, this title will still be of interest to developmental psychologists and educationalists, and advance students in these fields.

Child Neuropsychology, Volume 2: Clinical Practice attempts to bridge the gap between neurodevelopmental theory and clinical practice with a pediatric population. The focus is on some of the more common neuropsychological disorders encountered in children, along with neuropsychological evaluation, intervention, and treatment. Comprised of 11 chapters, this volume begins with an overview of issues and perspectives in clinical child neuropsychology, followed by a discussion on neurodevelopmental learning disorders in children. The neuropsychological basis of psychiatric disorders in children are then examined, together with epilepsy and closed-head injury as well as different approaches and issues relevant to neuropsychological evaluation of children. Subsequent chapters deal with the importance of soft signs and neuropsychological screening; neuropsychological assessment of children; actuarial and clinical assessment practices; and intervention and treatment. The book also presents an overview of how one might conceptualize and integrate differential diagnosis of neurodevelopmental learning disabilities with appropriate curriculum-based intervention strategies. The final chapter considers the broader applications of behavioral neuropsychology. This book is relevant to clinical child or pediatric neuropsychologists, child or school psychologists, physicians interested in pediatric neuropsychological disorders, and other professionals who provide services to children with neurologically based disorders. It may also serve as a reference for audiologists, speech and language therapists, or educators.

The practice of primary health care has expanded beyond the "traditional" medical model. Primary-care physicians and allied professionals are called upon more frequently to address parental concerns about developmental delays, poor school performance, or behavioral problems. As a result, pediatricians, family practitioners, pediatric nurses, social workers, and speech-language specialists are faced with the issue of developmental and psychological testing. The degree of the clinician's involvement in testing varies from the interpretation of reports to performing screening or assessments. In many cases, the primary health care professional assumes the role of case manager. Unfortunately, cooperation between disciplines often has been limited because of poor communication, particularly in regard to developmental and psychological testing, where acronyms, statistics, and jargon abound. Even professionals from mental health disciplines such as child psychiatrists or psychiatric social workers sometimes are overwhelmed. The purpose of this book, therefore, is to provide the clinician with practical information regarding developmental and psychological testing, thereby making the health care professional an "educated consumer." This text does not simply describe how psychologists perform testing; rather, it provides information to help clinicians understand the tests contain, what their strengths and limitations are, and how they can be incorporated into practice.

Incorporating the latest developments in pharmacology and therapy, this fully revised Second Edition is an ideal quick reference for those who prescribe psychotropic drugs for young people. New and notable features include: discussions of new drugs and health supplements; revised diagnostic terminology that accords with current DSM-IV nomenclature; reports on anti-epileptic medications; guidelines for the appropriate use of psychoactive medications; and instruction on the monitoring of physical, behavioral, and cognitive effects of various drugs. The handy spiral format makes the book easy to use.

Autism: New Directions in Research and Education presents the results of research on autism and the experiences of the families of autistic children, as well as the trials and tribulations of a psychologist working with an autistic child. The successes and failures of educational programs are discussed, followed by a detailed and helpful account on the value and limitations of a method of teaching language through simultaneous use of signs and speech. This monograph consists of 25 chapters and opens with an overview of the various behaviors likely to be exhibited by autistic persons, along with the theory of autism. It then considers a person's presentation about stuttering in relation to early infantile autism. An important point emphasized throughout this work is that an autistic child can be helped only if a serious attempt is made to see the world from his point of view, so that the adaptive function of much of his peculiar behavior can be understood in the context of his handicaps. The following chapters explore individual differences in the acquisition of sign language by severely communicatively-impaired children; the autistic child's disturbances of perception, speech, and language; and the nature and relevance of simultaneous communication with autistic children. This book should prove useful to clinicians, researchers, parents, teachers, and students.
