As the frequency of hemodialysis sessions has always been a concern, it is not astonishing that interest in quotidian (daily) hemodialysis appears to be growing worldwide. The main reasons for more frequent dialysis are to maximize well-being and minimize both intra- and interdialytic symptoms, as well as to improve the treatment of patients with severe underlying medical problems, particularly cardiovascular disease. Moreover, studies also indicate overall potential cost savings as compared with current conventional hemodialysis. There are two options available, namely short daily and long nightly treatments. The main difference centers on the ability of the nightly regimen to remove greater amounts of phosphate and beta-2-microglobulin. Even so, there is no doubt that both treatments are highly preferable to conventional three times weekly dialysis. Further issues which are discussed include the requirements necessary to run dialysis programs, vascular access requirements, and the management of complications and risks such as calcium and phosphorus control. This is the first publication devoted solely to daily hemodialysis therapies: Concentrating on clinical and technical issues, it is an important contribution to the practical development of daily hemodialysis and is highly recommended to nephrologists, nurses, managers of renal programs and others involved in renal care.

This book aims to educate general and vascular surgeons on all pertinent aspects of peritoneal dialysis (PD). Most surgeons get very little training in residency on this topic, and the use of PD is growing around the world. Much of the book will focus on implantation techniques, especially laparoscopic insertions. The authors will describe the known adjunct procedures that have been shown to decrease dysfunction rates. The aim is to provide greater patient autonomy, a better quality of life, preservation of residual renal function and a higher survival advantage. Completely revised edition of a global resource first published in 1978 and previously revised in 1989. Sixty-three contributions are arranged in sections on the pathophysiology of the uremic syndrome--principles and biophysics of dialysis; technology of dialysis and associated methods; quantification and prescription; complications; pharmacological considerations; special clinical situations; organ system and metabolic complications; and organization and results of chronic dialysis. The aim is to give understanding of the complexities of modern dialysis apparatus so that practitioners can make the best use of the technology--and so that fledgling nephrologists can avoid the temptation to by-pass the theory and the nuances. This is a time in history when the concept of Quality is reaching new highs in terms of public awareness. Articles describing quality, CQI, quality tools, critical success factors, failures, and lessons learned appear in local news papers, trade journals, scientific periodicals, and professional publications on a daily basis, yet implementation of a quality system in many hospital units is approached with caution and the basic tenants of quality systems and CQI continue to be misunderstood. In the United States, today, the public debate on healthcare issues rages on. Advances in Computer Assisted Learning contains selected proceedings from the CAL Symposium on Computer Assisted Learning held at the University of Nottingham in the UK in 1985. This book reviews advances in computer-assisted learning in the areas of curriculum development, visually handicapped and disabled students, project work in schools, television, viewdata and video applications, database applications, and engineering education and training. This monograph has 35 chapters and opens with a discussion on the computing aspects of interactive video, focusing on the design and production of the software used to control the videodisc developed by the Open University in the UK. The next chapter illustrates a variety of case studies whereby local viewdata has been exploited by both teachers and their pupils in different parts of Europe. Attention then turns to the use of computer-assisted communication in the education of the visually impaired; the use of microcomputers in teaching electronics; and theoretical considerations in selecting software for language arts. This text will be of interest to educators and policymakers who want to implement computer technology in the classroom.
