Among global environmental issues, climate change has received the largest attention of national and global policy makers, researchers, industry, multilateral banks and NGOs. Climate change is one of the most important global environmental problems with unique characteristics. It is global, long-term (up to several centuries) and involves complex interactions between climatic, environmental, economic, political, institutional and technological pressures. It is of great significance to developing countries as all the available knowledge suggests that they, and particularly their poorer inhabitants, are highly vulnerable to climate impacts. The projected warming of 1.4 to 5.8° C by 2100 and the related changes in rainfall pattern, rise in sea-level and increased frequency of extreme events (such as drought, hurricanes and storms) are likely to threaten food security, increase fresh water scarcity, lead to decline in biodiversity, increase occurrence of vector-borne diseases, cause flooding of coastal settlements, etc. Recognizing the potential threat of severe disruptions, the United Nations Conference on Environment and Development was organized in 1992 in Rio de Janeiro, Brazil to begin to address ways to reduce these impacts, which led to the formulation of the UN Framework Convention on Climate Change. This Convention and the subsequent Kyoto Protocol recognize "the common but differentiated responsibility" of developing and industrialized countries in addressing climate change. Developing countries thus have a unique role to play in formulating a sound, reasoned, and well informed response to the threat of climate change.

'The broad sweep of "green taxation" pollution, carbon, resource and land taxes, and tax incentives for environmental goals makes it complex to analyse. Green Taxation in East Asia is a timely and valuable comparative contribution to an expanding literature. Its scholarly country studies show how green taxes aim to modify behaviour, correct externalities, regulate, or raise revenue. As environmental policy and tax policy move closer together, green taxes become feasible, but are always, as the editors say, "shaped by local political, economic and social circumstances".' Miranda Stewart, University of Melbourne, Australia *'In today's world, environmental challenges grow apace and the impact of taxation measures on these will prove critical. Green Taxation in East Asia addresses those challenges. It draws on world-wide*

experiences (including those from North America and the EU) by analysing and critiquing how green taxation can inform, develop and implement environmental policies in East Asia (and beyond). This is not a sterile tax debate. The authors of this work, all leading scholars in their respective jurisdictions, combine economic, social and local political perspectives on what should work and what should not. The debate is too important to ignore in a world where Kyoto seems a long way from Washington, the fragrant harbour is no longer, and even in the lands down-under, long white clouds and pristine beaches are no longer taken for granted. Taxation is not a panacea for curing environmental ills; but it is, as this book admirably shows, part of the answer.' Andrew Halkyard, University of Hong Kong *'The right of East Asia to grow its economy and provide its citizens with living standards enjoyed elsewhere is as undeniable as the risk to the global environment from this growth. A volume that contrasts current initiatives in China and Hong Kong to reduce that risk with lessons from international experience presented by leading international experts from four continents, is more than just timely; it can make a key contribution to the development of contemporary thinking on taxation and the environment. This work fits the bill perfectly.'* Rick Krever, Monash University, Australia *'The authors of the jurisdictional chapters in this book are, of necessity, more focussed on analyzing the interaction, today between taxation (and related fiscal measures) and the environment. From these studies it is clear that a great deal is amiss in the way this interface works at present across all the jurisdictions under review. But this research also shows positive steps being taken and great scope for further, positive tax policy development. We can see from this research how smart policy innovation can start right now and also how it can build better foundations for the introduction of more comprehensive, globally effective policy frameworks such as those advanced by Hansen and Sandor. Time is of the essence. The scholarship in this volume shows that lawyers and tax experts are engaged in finding solutions. Can green taxation make a difference? The answer is a resounding "yes".'* From the foreword by Christine Loh *The core concern of this book is the potential use of taxation and related measures to foster climate-helpful, large-scale change within East Asia. The contributing authors examine key issues such as how Greater China, for instance, confronts severe environmental problems which are a direct product of several decades of remarkable economic growth. The detailed analysis in this book identifies a range of green taxation guidelines for East Asia as it seeks to drive down striking levels of environmental degradation and tackle the climate change challenge.*

Addressing an important need in the public policy debate, this book will appeal to academics, students, government policymakers, regulators and practitioners in environmental law, taxation law and policy, as well as, comparative environmental law and comparative taxation law and policy. Public policy commentators and journalists with an interest in the above areas will also find this book worthwhile and informative.

Document from the year 2019 in the subject Business economics - General, , language: English, abstract: Climate change has been one of the most explosive social and political issues for years. In order to contain it effectively, politicians must act quickly and consistently. So far, however, it has not yet used all resources and is easy on companies. This publication explains how the economy and the environment are interdependent. Is it possible to advance climate protection and at the same time promote economic growth? Environmental taxes can be the decisive step here. Basically, there is a conflict between ecological problems and economic interests. However, monetary incentives can regulate the behavior of companies. In this book, companies learn how they can implement climate protection measures in various areas of the company. Traditional public finance theory may be applied to the internalization of international environmental externalities. The policy constraint imposed by the absence of sovereign international government may be partially overcome through international environmental agreements. Instruments such as cost sharing, found in existing agreements, are generally unsophisticated. Two proposals entailing improved instruments are considered: (a) an international carbon tax, and (b) a global commons trust fund financed by earmarked excise taxes or charges. Political realities appear to preclude the early adoption of sophisticated international environmental taxes, but modest improvements in the

A comprehensive analysis of an environmental tax reform where people are taxed on pollution and the use of natural resources instead of on their income, it looks at the challenges involved in implementing this tax reform across Europe.

The interlinked issues of air pollution and energy policies in an enlarged Europe are currently subjects of major interest in economic, environmental, geography and regional sciences. This interest is understandable given the considerable consequences on human health and on climate change issues at not only a European, but a global level. In addition, the recent effects of economic fluctuation and oil prices as well as the actual restructuring of the European energy supply and security market raise a great deal of policy challenges. These issues have become an increasingly relevant concern, as the optimal design of policy by centralised European institutions has come under greater scrutiny. This book presents an integrated approach to recent regulations on air pollution with particular emphasis on transborder air pollution, climate change and energy policies in the new Europe. This integrated vision embraces the extent to which global pollution influences policy decisions at different institutional levels; the magnitude, by virtue of policy simulation analysis, of environmental policy tools (i.e. environmental taxes) on aggregate welfare and transboundary air emissions fluxes in light of the recent enlargement process; the European Trading System and its flexible mechanisms to curb carbon emissions and fulfil the European Union Kyoto Protocol's commitments; and the developments of the new European energy strategy and its interdependencies across energy requirements, innovation, competitiveness and climate change. The book is primarily aimed at Postgraduates and Postdoctoral research students in economics, environmental economics, environmental sciences, or environmental policy disciplines. However, it should also be of interest to environmental economists, energy policy analysts, members of governmental and non-governmental agencies dealing with environmental policy, climate change or air pollution.

Critically assessing recent developments in environmental and tax legislation, and in particular low-carbon strategies, this timely book analyses the implementation of market-based instruments for achieving climate stabilisation objectives around the world.

Critical Issues in Environmental Taxation is an internationally refereed publication devoted to environmental taxation issues on a worldwide basis. It seeks to provide insights and analysis for achieving environmental goals through tax policy. By sharing the perspectives of the authors in response to the diverse challenges posed by environmental taxation issues, effective approaches used in one country may be considered and possibly implemented by governmental authorities in other countries. Each volume contains pioneering and thought-provoking articles contributed by the world's leading environmental tax scholars. This eight volume includes 42 articles on environmental tax issues which were presented at the Tenth Global Conference on Environmental Taxation. It features articles in six areas relating to environmental tax reforms: experiences and potential, market-based instruments for climate protection, market-based instruments for environmentally sound management of energy, market-based instruments for environmentally sound management of water, market-based instruments for environmentally sound management of urban areas, and evaluation of market-based environmental policies. The quality of the articles published in Volume VIII reflects the excellent and inspiring work of leading scholars and practitioners in the field of environmental taxation.

The book combines perspectives from leading environmental taxation scholars on both the theory and impact of different policies. It covers topics such as theoretical assumptions of environmental taxes; the relationship between environmental taxes and t

This publication contains technical papers discussed at the tax workshop held in Paris in November 1991 and organised by the OECD. The book draws on actual experiences in designing tax systems to address the global warming problem, and reviews the key design problems likely to be encountered in expanding their use in this field.

“The scope, depth and persistence with which this book explores carbon pricing is admirable, reflecting that despite political reluctance it is a topic in all parts of the world.” _ Mikael Skou Andersen, Aarhus University, Denmark and European Environment Agency “Environmental taxation and emissions trading continue to be high on the public policy agenda in many countries, and this is another welcome and very interesting volume in the Critical Issues in Environmental Taxation series that presents new ideas and evidence on these subjects from a wide range of countries and a variety of perspectives.” _ Paul Ekins, University College London, UK This original and timely volume provides unique insights and analysis on the pressing question of how to achieve environmental sustainability while fostering economic growth. The emphasis of the book lies in finding critical solutions to global climate change including chapters on environmental fiscal reform and unemployment in Spain, EU structural and cohesion policy and sustainable development, ecological tax reform in Europe and Asia, Australia’s carbon pricing mechanism, and many other timely topics. This insightful volume will appeal to policy makers in government as well as academics and students in environmental law, environmental economics and environmental sustainability.

The Efficacy of Emissions-Related Motor Taxation
Volume VI: International and Comparative Perspectives

Inhaltsangabe:Introduction: The link between greenhouse gases and global warming is scientifically well established nowadays. The burning of fossil fuels causes a large part of the world s greenhouse gas emissions. For example, the burning of a ton of coal leads to the release of a certain amount of carbon dioxide into the atmosphere where it adds to the presently already increased stock of greenhouse gases. Consequently any further burning of coal is exacerbating the problem of climate change. This externality calls for political intervention on resource markets and the question arises which policies should be implemented. In this thesis, the multitude of optimal solutions taxation offers is derived. Any analysis of possible policy options on this topic has to consider that fossil fuels are no normal goods. Their total supply over time is determined only by nature. The owner of a resource deposit earns profit by extracting a given stock in time. Correspondingly, the value of the resource deposits is being determined by the discounted stream of future profits that can be expected from selling the stock (which can be affected by future changes in regulation). This implies that a regulator should pay special attention to the reactions of the supply side of fossil resource markets to his policies, but it also allows him to use a broad range of regulation policies regarding taxation. The clue is to set different incentives to extract the resource at different points in time. The resulting multiplicity of policy options can be used to correct different kinds of market failure. Sinn summarized the relationship between political intervention and supply side reactions against the background of climate change in his theory of the green paradox . It states that a lenient gradually tightening environmental policy leads to the counterproductive effect of falling resource prices and an increase in resource extraction in the present and the near future. This effect and the insight that gradually relaxing measures set the right incentives led Sinn to recommend falling tax rates as the optimal regulation policy to slow down climate change. Another aspect that threatens the future profits of resource owners is the development of substitutes to fossil resources, for example alternative methods of energy production. The availability of those technologies sets an upper limit to the market price of fossil fuels and leads to a faster depletion of the (economically [...]

Seminar paper from the year 2018 in the subject Environmental Sciences, grade: 2,3, University of Kassel (Institut für Betriebswirtschaftslehre), course: Umweltökonomie, language: English, abstract: Climate Change is reality. The extreme weather conditions are increasing from year to year on the entire planet and it is also noticeably hotter in Germany. Each of the last summers was hotter than the previous summer and thus the hottest in many years. But what is to do to avoid a climate disaster? Can environmental taxes be the solution? This paper deals with what environmental taxes are and what influence they have on emissions in the EU. In the first chapter some terms are defined which are important for the future course. Chapter 3 is about Environmental taxes, what a Pigovian Tax is, what is hidden behind the term Double Dividend and what the environmental tax reform is. In the last chapter the impacts of the environmental tax reform in Europe is pointed out, with a view as well on economic as also on environmental impacts.

Governments around the world are struggling to meet their commitments to achieve targets relating to reductions in greenhouse gases. Many writers advocating ways to achieve these targets offer radical but often impractical approaches that do not offer a way forward within the existing economic model. In contrast, Towards Ecological Taxation is a pragmatic consideration of realistic possibilities by an author from the world of accounting. Based on his research into the implications of changes in the UK motor taxation regime for company cars, David Russell considers the broader efficacy of taxation policy as a mechanism for reducing demand for fossil fuels and encouraging a shift towards carbon-neutral energy production. He incorporates the findings of a number of studies into his analysis, along with a wider consideration of tax regimes. Dr Russell suggests a way forward that will attract the interest of researchers, policy makers and decision makers wanting a better understanding of how taxation could be used innovatively, but within the existing economic status quo, to deliver specific and measurable reductions in CO₂. Such a distinctive approach makes this book a valuable addition to the literature on environmental issues and the always thought provoking titles in the Corporate Social Responsibility Series.

Although the world faces many environmental challenges, climate change continues to demand attention. This timely book explores ways in which market-based instruments and complementary policies can help countries meet their climate change goals. The chapters explore carbon pricing and other tax and non-tax measures, offering useful market-based perspectives that can help inform the many climate policy decisions that lie ahead.

This research paper, first, briefly highlights the consequences of climate change and the importance of environmental taxes as instruments that have, rightfully, gained popularity in the last decades to cope with these consequences. However, as its core topic requires, the paper discusses that the abundant presence, inconsistent and not harmonized implementation of these environmental taxes in tax systems and their uncoordinated application in the international tax arena have put an increasing burden on the business community. The different environmental tax concepts and their discrepancies with a focus on the reasons for and the consequences of the current situation is also examined (chapter 1). In chapter 2, special attention is paid to the interaction between the Emission Trading Schemes and energy taxes, to the burden the parallel existence of these instruments represents and to the current state and the revision of the taxation of energy products in the EU. Finally, a possible environmental-driven introduction of border tax adjustments, their trade (competition), policy and tax law implications is discussed (chapter 3).

'Environmental Taxation in China and Asia-Pacific contains a rich collection of papers addressing issues of vital importance to policy formulation in a spectrum of environmental areas. While not everyone would agree to all that is said in each of the papers, the book will certainly trigger fruitful debates. It is also a great source of information on environmental policy developments in major economies that will need to play an increasing role in addressing major issues such as climate change mitigation.' with focus on China and the Asia-Pacific. Legal, economic and policy contributions offer great insight in the present situation and future developments in this fascinating part of the world.' Kurt Deketelaere, K.U. Leuven, Belgium, University of Dundee, UK and University of Qatar *Environmental Taxation in China and Asia-Pacific* contains an integrated set of detailed chapters providing insights and analysis on how fiscal policy can be used to achieve environmental sustainability. Highly topical chapters include energy tax policy in China, environmental fiscal reform, carbon tax policy in northeast Asia and environmental taxation strategies in China, Asia and Australia, as well as many other relevant topics. Written by distinguished environmental taxation scholars from around the world, the emphasis of this book is on finding solutions to environmental problems which merit serious consideration by policy makers as well as academics in environmental law and other academic disciplines.

This timely book focuses on achieving a sustainable future through the reform of green fiscal policy. Green fiscal policies help not only provide the needed financing but may also serve the Sustainable Development Goals adopted by the United Nations in 2015. In this volume environmental tax experts review the development of fiscal carbon policy, consider the impact of green taxation on trade and competition, analyse the lessons learned from national experiences with fuel and energy pricing, and evaluate a variety of green economic instruments.

to the implementation, the political acceptance and the impact on the economy. The authors' effort is very successful in endowing academicians, policy makers and the general public with an excellent proof of the effectiveness of environmental taxes and green tax reforms. Æ Alberto Majocchi, University of Pavia, Italy ÆPutting the words Æenvironment' next to Ætaxation' might not always be the flavour of the month, but no modern society can ignore the value of the natural environment and the need to maintain its good quality and no competitive economy can prosper without the necessary tax revenues to function. I welcome this contribution to the literature. Æ Commissioner Connie Hedegaard, European Commission ÆThe Milne and Andersen volume provides a splendid treatment of environmental taxation that encompasses the basic conceptual issues, problems of tax design and implementation, and several insightful case studies that show how environmental taxes actually work in practice. It is the best overall treatment of environmental taxation available: comprehensive, rigorous, and readable. Æ Wallace Oates, University of Maryland, US The Handbook of Research on Environmental Taxation captures the state of the art of research on environmental taxation. Written by 36 specialists in environmental taxation from 16 countries, it takes an interdisciplinary and international approach, focusing on issues that are universal to using taxation to achieve environmental goals. The Handbook explores the conceptual foundations of environmental taxation, essential elements for designing environmental tax measures, factors that influence the acceptance of environmental taxation, the variety of ways to implement environmental taxes, their environmental and economic impact and, finally, the larger question of the role of taxation among other policy approaches to environmental protection. Intermixing theory with case studies, the Handbook offers readers lessons that can be applied around the world. It identifies key bodies of research for people who are already working in the field or entering the field and highlights issues that call for more research in the future. With systematic analysis of key issues in environmental taxation, this book will appeal to researchers, governments, think tanks, NGOs, and academics in law, economics, political science and public finance, as well as students specializing in environmental taxation and other market-based instruments.

The theoretical arguments for environmental taxes and other types of economic instruments for environmental protection have been discussed extensively in the literature. Rather less well discussed has been the extremely complex form that such instruments have in fact taken in practice. Environmental Taxation Law: Policy, Contexts and Practice examines the legal implications of introducing environmental taxes and other economic instruments into the regulatory framework of UK law. In doing so, it analyzes and explains the difficulties of grafting environmental taxes onto the complexities of existing regulatory structures, not all of which, of course, were originally devised with environmental considerations in mind. Although the focus of the book is the UK's pioneering implementation of a web of distinct yet interrelated policy measures, it locates the UK's taxes and instruments not simply in their broader context of market and environmental regulation, but also in the contexts of European and international law.

Climate change is one of the biggest challenges facing the world today and requires an urgent response from Government, industry and the individual. This inquiry was triggered by the publication of the Stern Review on "The Economics of Climate Change" (2006,

ISBN 9780102944204), which stressed the need to stabilise carbon emissions sooner rather than later, and warned of potentially catastrophic impacts if that was not achieved. The Review framed the climate change debate in terms of economic choices, and considered the use of economic tools such as environmental taxation and permit trading schemes as economically-efficient mechanisms for cutting emissions. This Report recommends that the Government give primary consideration to the use of economic tools in combating climate change: The Treasury's policies and action in this regard were the main focus of the inquiry. The report looks at work on this topic by the Treasury and other select committees. It then assesses the economics of the Stern Review, and examines the Government's approach to reducing emissions. Further sections cover emissions trading schemes, environmental taxes and adaptation (designed to counter the negative impacts caused by time lags in global and local ecosystems). The Committee calls for a twin track approach involving both adaptation and mitigation.

At a time when climate change and the Covid-19 pandemic pose a global existential threat, this timely and important book explores how policy responses to a pandemic create both opportunities and challenges for the increased use of environmental pricing instruments, such as carbon taxes, and tradable permit schemes, and targeted green fiscal incentives. After reviewing the previous modeling studies on climate change on the global level and for Korean cases, the study builds a model that explores the relationship of the economy, fossil fuel taxes, and CO2 emissions, mainly referring to Nordhaus' RICE model. Two contrasting scenarios, the mainstream world scenario and the ecological world scenario are set up as reference cases, and policy simulations are conducted for the period up to 2100 to address the research questions.

This book explores how tax policy can solve environmental problems, using a multi-jurisdictional and multi-disciplinary approach. The book provides a detailed analysis of environmental taxation with examples from around the world.

The Political Economy of Environmental Taxation in European Countries

The Paris Agreement's key objective is the strengthening of the global response to climate change by transitioning the world to an increasingly green economy. In this book, environmental tax and climate law experts examine carbon taxes energy subsidies, and support schemes for carbon and energy policies. Chapters reflect on the underlying policy dynamics and the constraints of various fiscal measures, and consider the harmonisation of smart instrument mixes.

This book offers an extensive analysis of carbon-energy taxation that addresses the interplay between carbon-energy taxation and emissions trading, as well as the implications for future international climate policy.

The Committee reports on the progress made by the Treasury in placing environmental objectives at the heart of its fiscal policies. This year's pre-Budget report (Cm. 6701, December 2005, ISBN 0101670125) is found to be inadequate, especially in the context of UK CO₂ emissions actually increasing once more. No significant new measures were announced, and the Committee sees a continued slowing down of the Treasury's momentum in turning rhetoric into action. It believes the Treasury should redefine Air Passenger Duty (APD) as an environmental tax and that APD rates should more accurately reflect the carbon emissions of the flights to which they apply.

Charging APD on flights rather than passengers could also act as an incentive to more efficient use of aviation fuel. The Committee also recommends action on aviation fuel duty, biofuels, car energy efficiency, steps to wean the economy off over-reliance on oil, stamp duty and council tax reductions for homes built or refurbished to high environmental standards. Each pre-Budget report should include figures on total revenue from the climate change levy, aggregates levy, and landfill tax. Although the Treasury accepts the principle of increasing taxes on "bads" rather than "goods" its reluctance for bold reform of the tax system mystifies the Committee. A Green tax Commission should be reconsidered, to develop a proper communications strategy to sell the environmental programme to the public. The Committee exhorts the Government to make moves on the climate change problem, as waiting for universal agreement is a recipe for stasis. Finally, the Committee regrets the Treasury's decision to abolish the Operating and Financial Review required from large companies, in that it appears to view sustainable reporting as an optional extra. It hopes that the proposed new business reviews will continue to require some form of social and environmental disclosure from companies.

Environmental Taxation in the Pandemic Era Designing a Practical Tax System

A key area of public policy in the last twenty years is the question of how, and how much, to protect the environment. At the heart of this has been the heated debate over the nature of the relationship between economic growth and environmental sustainability. Is environmental sustainability economic growth or 'green growth', a contradiction in terms? Avoiding the confusion that often surrounds these issues, Ekins provides rigorous expositions of the concept of sustainability, integrated environmental and economic accounting, the Environmental Kuznets Curve, the economics of climate change and environmental taxation. Individual chapters are organised as self-contained, state-of-the-art expositions of the core issues of environmental economics, with extensive cross-referencing from one chapter to another, in order to guide the student or policy-maker through these complex problems. Paul Ekins breaks new ground in defining the conditions of compatibility between economic growth and environmental sustainability, and provides measures and criteria by which the environmental sustainability of economic growth, as it occurs in the real world, may be judged. It is argued that 'green growth' is not only theoretically possible but economically achievable and the authors show what environmental and economic policies are required to achieve this. *Economic Growth and Environmental Sustainability* will be welcomed by students of and researchers in environmental economics and environmental studies, as well as all interested policy-makers.

The best fiscal system for a country is the one that allows maximum revenue in the long run, satisfying both efficiency and equity. Environmental taxes are consistent with these criteria. Not only it is fair to tax "bads," such as pollution or excessive use of natural resources, rather than "goods," such as labor and profits, it is a known result in the received literature that green taxes have a positive effect on the development and diffusion of new technologies. GDP (and possibly employment) increases will follow, which in turn secure an increase in the long run tax revenue. This book aims to encourage the study of fiscal reforms – consistent with ongoing environmental problems – by addressing a variety of efficiency and equity related issues under different perspectives and in relation to different countries. Moreover the book emphasizes that "green tax reform" requires further action than the introduction of one or two green taxes.
