History of Quantity Surveying in Australia

Quantity Surveyor's Pocket Book

There are few books on building measurement available that have been written specifically for Australian students. This shortage has meant that those teaching building measurement have largely had to produce their own teaching materials while relying on the one or two books that have been available. Several years ago the NSW chapter of the Australian Institute of Quantity Surveyors (AIQS) agreed to fund the preparation of a teaching resource that would be a useful addition to the limited selection of texts that were currently available; after a long period of gestation the first volume is complete. A second volume covering the remaining trades will follow in due course.

We live in a world deeply engrossed in materialism. To keep up with the craze, people do all sorts to acquire money. What some people do for money in some cases are unspeakable. Money is good no doubt but sadly, most men have become subservient to money which is supposed to be the servant. Unknown to most people, money is not a physical element, it is a spirit. There is a spirit called money. This book takes you on a discourse of the subject and attempts to draw attention to an angle almost every one ignores in the acquisition, retention, preservation and multiplication of money. It is recommended that the reader who isn't interested in the secret behind money should not read this book.

Now in its second edition, this essential book clearly and precisely explains all the procedures involved in compiling an estimate of the cost of construction work. Modern, updated coverage includes quantity takeoff, pricing of the contractor's work, pricing subtrade work, pricing site overheads, and compiling bid documents. This thorough grounding in the principles of construction estimating offers readers the skills required to successfully perform the work of a professional estimator. Drawings for two complete projects – one residential and one commercial – lead users through the complete estimating process for each and forms a basic framework that can easily be applied to various trades on many different types of construction projects.
