This book is intended as a supplement for courses in Management Information Systems (MIS). It uses cases to explain MIS concepts. It illustrates how computer-based information systems can be used to support an organization's objectives and strategic plans. The book's objective is to capture the material from a wide range of sectors such as health care, developmental activities, bank operations, microfinance, etc. and organize it around a framework that would be useful for students to understand how MIS can help in overcoming corporate challenges. It prepares students as managers, providing a clear focus on information, rather than data, and its use in business. These cases can also be used by practitioners as examples for designing MIS in their own organizations. For each case, the costs and benefits of the information system have been evaluated by calculating the Return on Investment (ROI). What is more, not only quantitative benefits, but also qualitative benefits (social and public benefits) have been identified to justify the need for technology-enabled MIS for supporting corporate strategies and operations. The book would be useful to students of MBA, BE (ICT), MCA and M.Sc. (Computer Science) courses. Besides, it would be of benefit to senior executives participating in Management Development Programmes.

*Financial dealer firms have invested heavily in recent years to develop information systems for risk measurement. I take it as given that technological progress is likely to continue at a rapid pace, making it less expensive for financial firms to assemble risk information. I look beyond questions of risk measurement methodology to investigate the implications of risk management information systems. By examining several theoretical models of the firm in the presence of asymmetric information, I explore how a financial firm's capital budgeting, incentive compensation, capital structure, and risk management activities are likely to change as it becomes less costly to assemble risk information. I also explore the likely effects of the falling cost of assembling risk information on a financial firm's organizational structure. Two common themes emerge: centralization within the firm and increased disclosure of risk information outside the firm are both likely to increase.*

"The economies of most African countries rely heavily on agriculture and other land and land-based activities such as tourism, mining and livestock production. Indeed, these are the core activities through which African countries participate in the global economy. Moreover, land is key to food security and the social-cultural needs of most communities in Africa. It has also been established that the performance of most sectors of the economies of African countries is indeed tied to that of the land sector. The

management of this sector must therefore be accorded priority attention in all countries in order to unlock the overall performance of national economies. This is best done through comprehensive land policies developed to address all the cross-sectoral needs and the unique circumstances in each of the countries. It is in response to this challenge that the African Union(AU), the African Development Bank(AfDB) and the Economic Commission for Africa(ECA) embarked on an exercise to develop a continental framework to guide land policy formulation and implementation in AU member States. However, the effective formulation and implementation of land policies can only be best done in circumstances where all the land information necessary is available in a suitable, timely and up-to-date form to enable expedient decision-making by the policy planners in each of the sectors." -- provided by publisher.
