meditation, enabling access to deep flow states, transcendent states of consciousness, and higher brain potential The human brain is like a flowing river of potential. Until now, that river has been blocked, barricaded, and diverted by the primitive lower brain. The lower brain hijacks our ability to experience deeper flow and higher transcendent states of consciousness. It also guards against the full expression of the passionate human heart. Source Code Meditation (SCM), with its nine summits of transformation, effortlessly re-routes that lower brain diversion, allowing you to activate latent energy in your body, awaken your higher brain, enlighten your mind, and set your heart on fire to create a new world. With traditional meditation techniques, it often takes decades of practice for hours each day to confer significant changes in the mind and the higher brain. Few of us

make it to these rarified states of mind, due to the amount of time and the intensity of focus needed. With “brain first” SCM techniques, you mobilize latent energy in the body and direct it to energize and awaken the higher brain before meditation begins. With the higher brain prepped and tuned, meditation is efficiently received, leading to quantum breakthroughs in higher consciousness without years of practice as well as access to deep flow states, transcendent states of consciousness, and higher brain potential. Providing a simplified step-by-step guided process to SCM, Dr. Michael Cotton explains how to shift energy out of the lower “survive” brain into the higher “thrive” brain to bring confidence, clarity, and empowerment for transformative change in all areas of life. Distilled from the world’s most comprehensive philosophy, Integral Metatheory, SCM offers not only a way to

create the brain state necessary to change the mind, but the crystal clarity needed to use these advanced meditative states to actualize your potential and live your destiny to the fullest.

"This is MacLean's major work on the evolutionary development of the human brain. In its evolution the human forebrain expands along the lines of three basic formations that anatomical and biochemically reflect an ancestral relationship, respectively, to reptiles, early mammals, and late mammals. MacLean describes this as the Triune Brain."--Amazon.com viewed July 29, 2020

In an increasingly volatile, uncertain, complex and ambiguous world, achieving sustainable competitive advantage has never been more important, or more difficult. However, the key challenge for CEOs, senior executives and HR professionals is how to unlock the potential of their people, building a culture that

allows employees to perform to the best of their abilities and effectively attract, engage, develop and retain the staff needed for sustainable business success. Building an Outstanding Workforce is a must-have guide for all professionals looking to leverage the potential of their people and maximise value for all stakeholders. Including evolutionary psychology, neuroscience and personality psychology, this book takes an evidence-based approach to people management. With practical guidance, expert advice and case studies from companies including Alibaba, Barclays Banking Group, Patagonia, Tata Group and Qantas, Building an Outstanding Workforce covers all the key issues including how to tailor people management to address the motivations of different generations, the impact of emergent technology on the workforce, the shift in the skills employees now need to learn and develop and

and the social – has not until now been put forward. In **Emotion and Reason**, Warren TenHouten presents a truly comprehensive classification of the emotions. The book analyzes six key emotions: anger, acceptance, aggressiveness, love, joy and happiness, and anticipation. It places them in historical context, relates them to situations of work and intimacy, and explains their functioning within an individuated, autonomous character structure. Divided into four parts, the book presents a socioevolutionary theory of the emotions – **Affect-spectrum Theory (AST)**, which is based on a synthesis of three models, of the emotions, of social relationships, and of cognition. This book will be of value to undergraduate and postgraduate students, as well as

researchers, with an interest in the sociology of emotions, anthropology of emotions, social psychology, affective neuroscience, political science, behavioral neuroeconomics and philosophy.

Cory, Gardner, and their contributors argue that how the brain is constructed determines how people behave socially. This has been a neglected thesis, except for a few pioneers, of whom Paul MacLean has been most outstanding. His animal observations, brain research, and evolutionary formulations have formed the basis of new important initiatives discussed in this collection. This volume contains the results of research into the dialogue between theology and biology, particularly neuroscience and evolutionary theory. With regard to

neuroscience, the representational paradigm is abandoned in favor of the ecological brain theory, which understands the brain as an organ of resonance between the living body and its surrounding environment. In relation to theological epistemology, this account not only leads to fruitful convergences, but also shows that revelation, as perception of God's triune presence in creation, has to be understood as a resonating and non extra-ordinary or general kind of perception, instead of being a special interpretation of experiences that are beyond the ordinary. With regard to the theory of evolution, the Neodarwinian paradigm is expanded with the help of the theory of niche-construction, in which the relationship between organisms and their environment is

understood to be reciprocally resonating. This new and emerging paradigm in biology fits to a relational-narrative theological ontology, in which the relationship between the life of the triune God and creation can be modeled on basis of the key metaphor of niche construction understood as a reciprocally resonating dramatic coherence. Theologically, Markus Mühling presents a theory of revelation as perception and a relational-narrative ontology based on the concept of dramatic coherence, in which the triune life is understood not as an exception to ontology, but as the decisive condition of its possibility. For neuroscience and evolutionary theory it provides the insight that taking the concepts of internally related external relata and a phenomenological

approach into account leads to new horizons for solving those problems seen in certain older paradigms as posing irreconcilable contradictions. Mühlhling also argues that a dialogue between theology and the natural sciences – in order to be fruitful – must be maintained in relative dependence and independence, that any such dialogue must take philosophical considerations into account, and that it is decisive for each of the dialogue partners to speak on behalf of their proper and particular areas of research. The proposed results also reflect the author's participation in the dialogue between leading theologians and scientists at the Center of Theological Inquiry, Princeton (NJ) on Evolution and Human Nature in 2013.

Willcox helps you apply this to your own marketing and brand strategies.

Menschen, Ratten, Psychologen Was können uns ganz gewöhnliche Laborratten über das Menschsein verraten? Die Biopsychologin Kelly Lambert meint: sehr viel. Sie führt seit nunmehr fünfundzwanzig Jahren Forschungen an Ratten und anderen Nagetieren durch und ist dabei zu einer überraschenden Erkenntnis gekommen: Mit ihrer Anpassungsfähigkeit und ihren besonderen Lebensgewohnheiten vermögen uns diese bescheidenen Tierchen so einiges darüber beizubringen, wie wir als

Menschen ein besseres Leben führen können. Von emotionaler Resilienz und strengem Arbeitsethos bis hin zur effektiven Betreuung des Nachwuchses und zur Erhaltung der eigenen Gesundheit kann die Laborratte für uns alle ein – zugegebenermaßen ungewöhnliches – Vorbild sein. „Mit Witz, Klugheit und immer auf dem Boden der Tatsachen lehrt uns Kelly Lambert eine Menge über uns selbst, indem sie ihren Ratten die Bühne überlässt. Wenn wir die Grundlagen der Hirnfunktion bei der Ratte erforschen, können wir darin vieles entdecken, was auch für uns gilt, und erhalten ganz neue Einblicke in

Jan 1990 Hardcover

Given the past decade's explosion of neurobiological and paleontological data and their increasingly sophisticated analyses, interdisciplinary syntheses between these two broad disciplines are of value and interest to many different scientists. The collected papers of this volume will appeal to students of primate and hominid evolution, neuroscientists, sociobiologists, and other behaviorists who seek a better understanding of the substrates of primate, including human, behavior. Each species of living primates represents an endpoint in evolution, but comparative neurologists can produce

Download Free The Triune Brain In Evolution Role In Paleocerebral Functions By Paul D Maclean 31

Jan 1990 Hardcover

approximate evolutionary sequences by careful analyses of representative series. Because nervous tissue does not fossilize, only a comparison of structures and functions among extant primates can be used to investigate the fine details of primate brain evolution. Paleoneurologists, who directly examine the fossil record via endocasts or cranial capacities of fossil skulls, can best provide information about gross details, such as changes in brain size or sulcal patterns, and determine when they occurred. Physical anthropologists and paleontologists have traditionally relied more on paleoneurology,

Download Free The Triune Brain In Evolution Role In Paleocerebral Functions By Paul D Maclean 31

Jan 1990 Hardcover

whereas neuroscientists and psychologists have relied more on comparative neurology. This division has been a detriment to the advancement of these fields and to the conceptual bases of primate brain evolution. Both methods are important and a synthesis is desirable. To this end, two symposia were held in 1980--one at the meeting of the American Association of Physical Anthropologists in Niagara Falls, U. S. A. , and one at the precongressional meeting of the International Primatological Society in Torino, Italy.

Under the current mental health paradigm the

cognitive brain is deemed to be the most powerful part of the human brain. Therefore most treatment plans for mental disorders focus on this part of the brain only. This book will explain how the brainstem sensations, acting through the power of love, is actually the most influential and intelligent part of the human brain. This knowledge turns a lot of what we think we know about the human condition on its head, and in the future should form the basis of a whole new paradigm in understanding and treatment. Throughout human evolution the brain can be thought of as evolving in three

Download Free The Triune Brain In Evolution Role In Paleocerebral Functions By Paul D Maclean 31

Jan 1990 Hardcover

separate stages. The earliest and most ancient brain is our brainstem, which deals in sensation only. That means for a long time during our evolution we managed to live by sensing ourselves and our environment we lived in. In other words the internal communication process or 'language' of the brainstem is through sensation only. Later our limbic system evolved and its language is 'feeling'. The limbic system grew out of and sits on top of the brainstem (see front cover). The brainstem with its sensations and the limbic system feelings combine to form what we can think of as our social brain.

Download Free The Triune Brain In Evolution Role In Paleocerebral Functions By Paul D Maclean 31

Jan 1990 Hardcover

Much more recently, in evolutionary terms, the cognitive brain evolved as part of the larger cortex, and is known as the prefrontal cortex. The cortex as a whole sits like a cover over the two earlier brains, and the language process of the prefrontal cortex involves thought and speech as we generally know it in its present form. In current scientific terms this overall structure is known as the triune brain. This book will show how early emotional trauma is registered as a painful sensation in the lower brain. The need to repress this pain (for survival reasons) from conscious awareness leads to a

Jan 1990 Hardcover

disconnection between the cognitive brain and the social/emotional brains. The disconnection between our three distinctly different levels of functioning is proving to be a fatal flaw. It allows humans to function from a cognitive or thinking position without the essential input from the deeper sensing/feeling brain areas that have so far been responsible for guiding our successful evolution. Importantly the disconnection between brain areas is also the root cause of nearly all mental illness, and the reason why humans have so much trouble relating to each other in loving ways.

Jan 1990 Hardcover

I agree with Wilson that there is a pressing need in the sciences today for the unification of the social with the natural sciences. I consider the present work to proceed from the perspective of behavioral ecology, specifically a subfield which I choose to call interpersonal behavioral ecology. Ecology, as a general field, has emerged in the last quarter of the 20 century as a major theme of concern as we have become increasingly aware that we must preserve the planet whose limited resources we share with all other earthly creatures. Interpersonal behavioral ecology, however, focuses not on the physical environment, but upon our social environment. It concerns our interpersonal behavioral interactions at all

Download Free The Triune Brain In Evolution Role
In Paleocerebral Functions By Paul D Maclean 31
Jan 1990 Hardcover

levels, from simple dyadic one-to-one personal interactions to our larger, even global, social, economic, and political interactions. Interpersonal behavioral ecology, as I see it, then, is concerned with our behavior toward each other, from the most obvious behaviors of war between nations, to excessive competition, exploitation, crime, abuse, and even to the ways in which we interact with each other as individuals in the family, in our social lives, in the workplace, and in the marketplace. In the past few decades, the study of the mind has been radiated in the field of cognitive neuroscience by numerous breakthroughs. At last, scientists have the ability to explain in unparalleled detail the intricate

Download Free The Triune Brain In Evolution Role
In Paleocerebral Functions By Paul D Maclean 31
Jan 1990 Hardcover

processes taking place inside the human brain. This field of cognitive neuroscience gives us the right tools to decipher the protocols which spawn behaviors, and confirm that our conscious thought is ruled by physiological networks predisposed to their natural environment. In *Thought Genesis*, David M. Sternberg takes us through a fascinating multidisciplinary voyage to unearth the very origins of thought. Much like an astrophysicist observes distant celestial objects to look back in time to beginning of the world, Sternberg examines the behaviors of lesser but fascinating species and reveals the very first moments our ancestors became aware and conscious of their environment. With

Download Free The Triune Brain In Evolution Role

Rational and Moral Basis of Organization, Exchange, and Choice (Kluwer Academic/Plenum Publishing, 1999) and Toward Consilience: The Bioneurological Basis of Behavior, Thought, Experience, and Language (Kluwer Academic/Plenum Publishing, 2000), it may also be considered to respond to the call for consilience by Edward O. Wilson. I agree with Wilson that there is a pressing need in the sciences today for the unification of the social with the natural sciences. I consider the present work to proceed from the perspective of behavioral ecology, specifically a subfield which I choose to call interpersonal behavioral ecology. Ecology, as a general field, has emerged in the last quarter of the 20th

century as a major theme of concern as we have become increasingly aware that we must preserve the planet whose limited resources we share with all other earthly creatures. Interpersonal behavioral ecology, however, focuses not on the physical environment, but upon our social environment. It concerns our interpersonal behavioral interactions at all levels, from simple dyadic one-to-one personal interactions to our larger, even global, social, economic, and political interactions.

3.8 billion years of evolution on Earth now rests on the shoulders of the evolution human consciousness. Unlike Neo-Darwinism and Intelligent Design, which are only concerned with life on Earth, the evolutionary intelligence theory explains the whole of evolution from the Big Bang to the present day. Richard Barrett takes on nothing less than the theory of evolution and adds immeasurably to our understanding. The elegant simplicity with which Richard guides us through his ideas is refreshing in this era

of the most important figures of the twentieth century, but tragically overlooked. Jaynes linked hypnosis to the bicameral (two-hemisphered) structure of the brain, and inferred that consciousness arose from the breakdown of a prior "master-slave" mode of functioning that he called the "bicameral mind". The architecture of consciousness is the opposite of the architecture of bicameralism. The former hasn't replaced the latter. It simply sits on top of it, and in certain circumstances the old architecture can

reassert itself. This is what happens with hypnosis. All of human behavior may be understood in terms of the ongoing conflict between these two architectures. Although most people seem conscious, they are often in a thinly-disguised bicameral mode that reflects the master-slave paradigm. This book is one of a series by the Pythagorean Illuminati.

domesticated plants and animals, human civilization as we know it would not exist. We would still be living at subsistence level as hunter-gatherers if not for domestication. It is no accident that the cradle of civilization—the Middle East—is where sheep, goats, pigs, cattle, and cats commenced their fatefully intimate association with humans. Before the agricultural revolution, there were perhaps 10 million humans on earth. Now there are more than 7 billion of us. Our domesticated species have also thrived, in stark contrast to

their wild ancestors. In a human-constructed environment—or man-made world—it pays to be domesticated. Domestication is an evolutionary process first and foremost. What most distinguishes domesticated animals from their wild ancestors are genetic alterations resulting in tameness, the capacity to tolerate close human proximity. But selection for tameness often results in a host of seemingly unrelated by-products, including floppy ears, skeletal alterations, reduced aggression, increased sociality, and

reduced brain size. It's a package deal known as the domestication syndrome. Elements of the domestication syndrome can be found in every domesticated species—not only cats, dogs, pigs, sheep, cattle, and horses but also more recent human creations, such as domesticated camels, reindeer, and laboratory rats. That domestication results in this suite of changes in such a wide variety of mammals is a fascinating evolutionary story, one that sheds much light on the evolutionary process in general. We humans, too, show

signs of the domestication syndrome, which some believe was key to our evolutionary success. By this view, human evolution parallels the evolution of dogs from wolves, in particular. A natural storyteller, Richard C. Francis weaves history, archaeology, and anthropology to create a fascinating narrative while seamlessly integrating the most cutting-edge ideas in twenty-first-century biology, from genomics to evo-devo.
